

Shore Stones

Sands and stones

Description

Kekkilä Shore Stones are variously coloured natural stones shaped by water. They have a variety of uses in the home garden. Readily absorbing heat in spring, they provide protection for frost-tender plants and those with roots near the soil surface. As mulch they also slow the development of weeds and help the soil retain moisture.

Shore Stones add a stylish finishing touch to planted areas. Their subtle colours go well with many kinds of plants. Rounded by water, Shore Stones make your garden pathways comfortable to walk on even barefoot. Placed under pots or over the soil around pot plants, they add beautiful details to the interior of your home. In water features, Shore Stones are the most natural decorative complement.

Instructions

Shore Stones are 8–12mm natural stones polished by water. Coverage when spread to a depth of 3cm: 8kg / 0.35m², 25kg / 1m² and 550kg / 15m².
